Adam Matthew Steinberger

Staff Software Engineer · Enterprise AI and platform engineering, discovery to production

I turn unclear business problems into AI and platform software that product teams adopt and that keeps running after I hand it over.

Available now for Staff+ engineering roles in industry. US-remote.

SUMMARY

For 14 years I've turned unclear business problems into production systems for insurance, lending, healthcare, manufacturing and industrial-testing teams. Most recently I architected AI platforms that put language models into real operational work, and built krypton and the vibey engine as a Claude Code and Codex killer—completely free, censorship-free, open to everyone, and writing code the way a principal software engineer does so teams get quality code not slop, advancing toward an AGI platform with superintelligence coming soon.

HIGHLIGHTS

- **Platforms other teams adopted.** Sole architect of a policy-enforced LLM gateway that three product teams moved onto, and they retired the credentials their apps held. My platform library runs in 17+ repositories.
- **Shipped in customer reality.** Co-led a 20-service AI payroll platform to production-ready architecture by day 45, with human-approved phases and an irreversible final submission; the junior developer I trained alongside it now owns it.
- **Fast from zero.** Two RAG chatbots delivered in 30 days each for different clients; a 59,000-line codebase reviewed in 10 hours with a phased roadmap.
- **Replaced tools, not just added them.** Snow Portal replaced Alteryx at a fraction of the cost, and a versioned sync API for 114+ directory groups replaced a low-code workflow.

EXPERIENCE

The Vizius Group Sep 2025 – Aug 2026

Senior Azure and AI Development Engineer • Greenville, SC

- **AI governance gateway** (sole architect, ~54k lines). One OpenAI-compatible API in front of Azure AI, Anthropic, OpenAI, Cursor, Grok and Gemini, with per-project allowlists and fallback policy, Redis rate limits, per-call cost attribution with hard spend caps, and an HMAC-signed, hash-chained, write-once audit trail. Callers authenticate with Entra ID over workload identity, so no API keys sit in the path; agent sandboxing, egress policy and SSRF checks map to the OWASP LLM Top 10 and NIST AI RMF. **Three product teams moved onto it** and retired their app-held credentials.
- **AI payroll automation platform** (co-lead, ~420k lines). Twenty microservices across four human-approved phases, with the final submission modeled as irreversible; RAG over the document store, AI-directed spreadsheet corrections and earnings review. I owned the Terraform, 20 Helm charts, GitOps and 10 CI/CD workflows, backed by 585 test modules. The architecture was **production-ready at day 45**, and the junior developer I trained in parallel now owns it.
- **Technical report platform** (lead, ~54k lines). Turns electrical-testing instrument data into standards-aware client reports: mail-webhook ingestion with per-document fan-out, a multi-vendor parser seam, a deterministic deficiency analyzer with LLM review, and blocking data-quality gates. Added SAML 2.0 and Entra dual-issuer SSO, replaced a shared API key with per-user bearer auth, and wrote the SOC 2 readiness assessment, STRIDE threat model and ADRs. **Ended silent false-success deploys.**
- **Identity governance as code** (sole author, two control planes). A Kubernetes operator (kopf) that reconciles directory governance against Git-declared custom resources, with fully secretless multi-tenant auth and an LLM that drafts pull requests for judgment calls. A second platform manages 40 identity-provider resource kinds with drift classification: safe drift is fixed automatically, destructive changes wait for a pull request and a human approval, and any point in time can be restored. A versioned, idempotent sync API for 114+ directory groups **replaced a low-code workflow**.
- **Secretless DevSecOps.** OIDC workload identity federation for 20 CI workflows across 9 repositories; supply-chain pipelines with SAST, SCA, IaC and secret scanning, SBOMs, keyless signing and policy-as-code admission. My own security reviews **caught an auth bypass, path traversal, SSRF, a timing-unsafe comparison, query injection and an over-scoped CI credential before release**. Led a cross-tenant production migration onto OIDC and least-privilege RBAC.
- **Shared platform library.** The firm's Python library for logging, alerting, dead-letter consumers and the outbox pattern, through three major versions; **adopted by 17+ repositories** and four platforms. It lives on in the open as vibey-bootstrap, part of vibey.

Lima One Capital May 2023 – Feb 2025

Senior Software Engineer • Greenville, SC

- **Rearchitected the core integration layer** from legacy MuleSoft APIs into NestJS microservices (gRPC and REST) on PostgreSQL, with ETL pipelines and connectors across HubSpot, SharePoint, Snowflake and Salesforce.
- **Built Snow Portal**, a Snowflake job scheduler that replaced Alteryx at a fraction of the cost; full-stack .NET and React work on a mortgage-broker platform (credit-report integrations, pricing-engine APIs).

Adam Matthew Steinberger LLC Mar 2025 – Aug 2025

Senior Software Engineering Consultant • Greenville, SC

- **Two RAG chatbots, 30 days each.** One fully self-hosted for a non-profit (Mistral-7B, FAISS and vLLM, with Grafana and Prometheus on every token and no external dependencies); one cloud-based for a sales agency (Gemini RAG with API-driven web search).
- **Codebase review.** 59,000 lines across 190+ files reviewed in 10 hours; found 5% test coverage and missing auth middleware, and delivered a technical brief, executive summary and phased roadmap.

The Vibey Project (open source) Aug 2026 – Present

Creator and maintainer • Greenville, SC

- **vibey & krypton** (MIT; on PyPI as vibey-engine). Built as a Claude Code and Codex replacement: completely free, censorship-free, and open to everyone. Writes code the way a principal software engineer does so users get rigorous, production-grade quality instead of code slop, completely free of charge—architected as an AGI platform with superintelligence coming soon.
- **Nothing is lost when an agent dies.** Every decision, finding and handoff is a row in an append-only PostgreSQL ledger. Workers claim jobs under SKIP LOCKED leases, and a handoff to another vendor must pass a model-free no-loss check or it retries, escalates or waits for a person. A chaos test runs 500 jobs on 8 workers, crashes a fifth of them mid-job, and passes only if **no job is lost or run twice**.

The Apologist Project Apr 2026 – Present

Volunteer Software Architect • Remote

- **Project Excite.** An adapter-based relay service that hands people from an AI chat to live volunteers on Chatwoot or EchoGlobal: an explicit session state machine with idempotent teardown, Redis-backed sessions, HMAC-verified webhooks and QStash-queued delivery. Shipped as split PR stacks with security hardening (DOMPurify, CORS allowlist, Sentry PII off, rate limiting).

EARLIER EXPERIENCE

Transcat, Senior Software Engineer (2022–2023). Led the team delivering .NET Web APIs and a React front end for lab-equipment calibration. • **LeaseTrack**, Senior Software Engineer (2021–2022). Python and AWS Textract document parsing; a Java Spring Boot annotation system feeding an ML training pipeline. • **Akmazio Software**, Founding Engineer (2020–2021). Built the full C#/.NET and SQL Server backend and wrote the business plan; managed interns and a contractor. • **Bestpass by Fleetworthy**, Software Engineer (2019–2020). Introduced automated unit testing to a legacy toll-billing system that had none. • **New York State Insurance Fund**, Software Engineer (2015–2019). Migrated VB6 systems to C# MVC, refactored Oracle EDI integrations and mentored junior engineers. • **Town and Country Computer Services**, Junior Software Engineer (2013–2015). Insurance quoting, rating and reporting apps used all day by underwriters; client-facing from the first day. • **GE HealthCare**, Junior Software Engineer (2012–2013). A browser-based CT/MRI viewer with real-time 3D scrolling; built its full internationalization feature.

SKILLS

AI & LLM systems: Multi-vendor LLM gateways with cost and policy governance, agent sandboxing and egress policy, multi-agent orchestration, MCP servers, RAG (pgvector, FAISS, Azure AI Search, Pinecone), human-in-the-loop gating, structured outputs; Claude, Azure OpenAI/Foundry, GPT, Gemini, Mistral, vLLM, Ollama

Platform & cloud: Private AKS (workload identity, KEDA), Terraform, Bicep, Helm, Kustomize, Flux/Argo CD GitOps, GitHub Actions, Service Bus, Event Hubs, Key Vault, Private Endpoints, App Gateway + WAF, OpenTelemetry, PostgreSQL, Redis, Cosmos DB, AWS

Data & integration: PostgreSQL, Snowflake, SQL Server, Oracle, MongoDB, Redis; ETL and API integrations (HubSpot, SharePoint, Salesforce, Microsoft Graph); event-driven pipelines (Service Bus, Event Hubs); data-quality gates

Languages: Python 3.12 (FastAPI, SQLAlchemy 2, Pydantic, kopf), TypeScript/NestJS, Next.js + React, C#/.NET, Java Spring Boot, SQL, KQL, Bash, gRPC/REST, OpenAPI

Delivery: Discovery, a written solution, decomposition into work, then a mentored handoff; executive summaries for stakeholders; Scrum (CSM); author of Security-First Scrum

OPEN SOURCE & PUBLICATIONS

- **vibey**. A Claude Code and Codex killer: completely free, censorship-free, open-source conductor for AI coding agents, five engine runners, the vibey-gh release tool, vibey-bootstrap and krypton apps for desktop, mobile, web and VS Code. Writes code like a principal software engineer with quality over slop, built toward AGI with superintelligence coming soon. MIT; pip install vibey-engine.
- **vibey-skills**. A 149-plugin Claude Code skills marketplace, shipped inside vibey.
- **Ledger-Mediated Orchestration: Vendor-Independent Autonomous Software Delivery over a Pool of Coding Agents**. Paper describing vibey's design (not peer reviewed).
- **Novice to Navigator: Your Guide to AI Chatbots for Business**. Plain-English guide to RAG chatbots for decision-makers; first edition free online (ISBN 979-8274310628).

EDUCATION & CERTIFICATION

Skidmore College, B.A., Computer Science (2010–2012) • **Rensselaer Polytechnic Institute**, Electrical and Electronics Engineering coursework (2008–2010) • **Certified ScrumMaster (CSM)**, Scrum Alliance (2021)
